#### **Abstract**

## 1 Setup

```
pacman::p_load("readr", "sf", "dplyr", "ggplot2", "RColorBrewer", "tidyr", "lubridate", "knitr")
theme_minimal() |> theme_set()
```

### 2 Tasks and inputs

#### 2.1 Task 1: Write your own functions

Create the following two functions:

1. A function which calculates a persons BMI based on their height and weight (Equation 1)

$$BMI = \frac{\text{Weight (kg)}}{\text{Height (m)}^2} \tag{1}$$

```
bmi <- function(weight,height) {
  weight/(height)^2
}</pre>
```

2. A function which converts degrees Celcius to Farenheight (Equation 2)

$$Farenheight = Celsius * 1.8 + 32 \tag{2}$$

```
farenheight <- function(celsius) {
  celsius * 1.8 + 32
}</pre>
```

3. A function which calculates the (Euclidean) distance between two sets of coordinates (x1, y1 and x2, y2) (Equation 3)

Euclidean Distance = 
$$\sqrt{(x_2 - x_1)^2 + (x_2 - y_1)^2}$$
 (3)

```
euclidean_distance <- function(x1, y1, x2, y2) {
   sqrt((x2 - x1)^2 + (y2 - y1)^2)
}</pre>
```

#### 2.2 Task 2: Prepare Analysis

In the next tasks we will look for "meet" patterns in our wild boar data. To simplify this, we will only use a subset of our wild boar data: The individuals *Rosa* and *Sabi* for the timespan 01.04.2015 - 15.04.2015. Use the dataset wildschwein\_BE\_2056.csv (on moodle). Import the csv as a data frame and filter it with the aforementioned criteria. You do not need to convert the data frame to an sf object.

```
df_wild_boar <- read_delim("data/wildschwein_BE_2056.csv") |>
mutate(across(where(is.character), as.factor)) |>
filter(
   TierName %in% c("Rosa", "Sabi"),
   DatetimeUTC |> between(
        as.POSIXct("2015-04-01 00:00:00", tz = "UTC"),
        as.POSIXct("2015-04-15 23:59:59", tz = "UTC"))
)
```

```
Rows: 51246 Columns: 6

002A	Sabi	12275	2015-04-01 01:15:17	2570320	1205247

#### 2.3 Task 3: Create Join Key

Have a look at your dataset. You will notice that samples are taken at every full hour, quarter past, half past and quarter to. The sampling time is usually off by a couple of seconds.

To compare Rosa and Sabi's locations, we first need to match the two animals *temporally*. For that we can use a join, but need *identical* time stamps to serve as a join key. We therefore need to slightly adjust our time stamps to a common, concurrent interval.

The task is therfore to round the minutes of DatetimeUTC to a multiple of 15 (00, 15, 30, 45) and store the values in a new column.

```
df_wild_boar_t3 <- df_wild_boar |>
  mutate(
    DatetimeRound = DatetimeUTC |> round_date(unit = "15 minutes")
)
```

```
df_wild_boar_t3 |> head() |> kable()
```

Table 2: Wild boar data with rounded datetime.

TierID	TierName Colla	arID	DatetimeUTC	E	N	DatetimeRound
002A	Sabi 12	2275	2015-04-01 00:00:11	2570372	1205313	2015-04-01 00:00:00
002A	Sabi 12	2275	2015-04-01	2570309	1205262	2015-04-01
002A	Sabi 12	2275	00:15:22 2015-04-01	2570326	1205248	00:15:00 2015-04-01
			00:30:11			00:30:00
002A	Sabi 12	2275	2015-04-01 00:45:16	2570315	1205242	2015-04-01 00:45:00

Table 2: Wild boar data with rounded datetime.

TierID	TierName	CollarID	DatetimeUTC	E	N	DatetimeRound
002A	Sabi	12275	2015-04-01	2570323	1205237	2015-04-01
			01:00:44			01:00:00
002A	Sabi	12275	2015-04-01	2570320	1205247	2015-04-01
			01:15:17			01:15:00

#### 2.4 Task 4: Measuring distance at concurrent locations

To measure the distance between concurrent locations, we need to follow the following steps.

1. Split the df\_wild\_boar\_t3 object into one data.frame per animal

```
df_wild_boar_Rosa <- df_wild_boar_t3 |>
  filter(TierName == "Rosa")

df_wild_boar_Sabi <- df_wild_boar_t3 |>
  filter(TierName == "Sabi")
```

2. Join these datasets by the new Datetime column created in the last task. The joined observations are temporally close.

```
df_wild_boar_joined <- left_join(
   df_wild_boar_Sabi,
   df_wild_boar_Rosa,
   join_by(DatetimeRound),
   suffix = c("_Sabi", "_Rosa")
)</pre>
```

3. In the joined dataset, calculate Euclidean distances between concurrent observations and store the values in a new column

```
df_wild_boar_dist <- df_wild_boar_joined |>
  mutate(
    dist = euclidean_distance(E_Sabi,N_Sabi,E_Rosa,N_Rosa)
)
```

4. Use a reasonable threshold on **distance** to determine if the animals are also *spatially close* enough to constitute a *meet* (we use 100 meters). Store this Boolean information (TRUE/FALSE) in a new column

```
df_wild_boar_t4 <- df_wild_boar_dist |>
  mutate(
    meet = (dist^2)^0.5 <= 100
)</pre>
```

#### 2.5 Task 5: Visualize data

Now, visualize the *meets* spatially in a way that you think reasonable. For example in the plot as shows below. To produce this plot we:

- Used the individual dataframes from rosa and sabi (from the previous task)
- Used the joined dataset (also from the previous task), filtered to only the meets
- Manually changed the x and y axis limits

```
df_wild_boar_t4 |>
  filter(meet) |>
  arrange(DatetimeRound) |>
  ggplot()+
    geom_point(data=df_wild_boar_Rosa,aes(E,N,color=TierName),alpha=0.2)+
    geom_point(data=df_wild_boar_Sabi,aes(E,N,color=TierName),alpha=0.2)+
    geom_point(aes(E_Rosa,N_Rosa,fill=TierName_Rosa), shape = 21, size = 2,color="black")+
    geom_point(aes(E_Sabi,N_Sabi,fill=TierName_Sabi), shape = 21, size = 2,color="black")+
    coord_equal()+
    guides(
    color = guide_legend(title = "Regular Locations"),
    fill = guide_legend(title = "Meets")
)
```

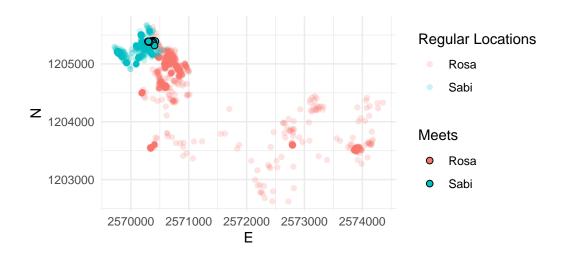

Figure 1: Wild boars; where Rosa and Sabi meets
